

SMARTCONNECTIVITY

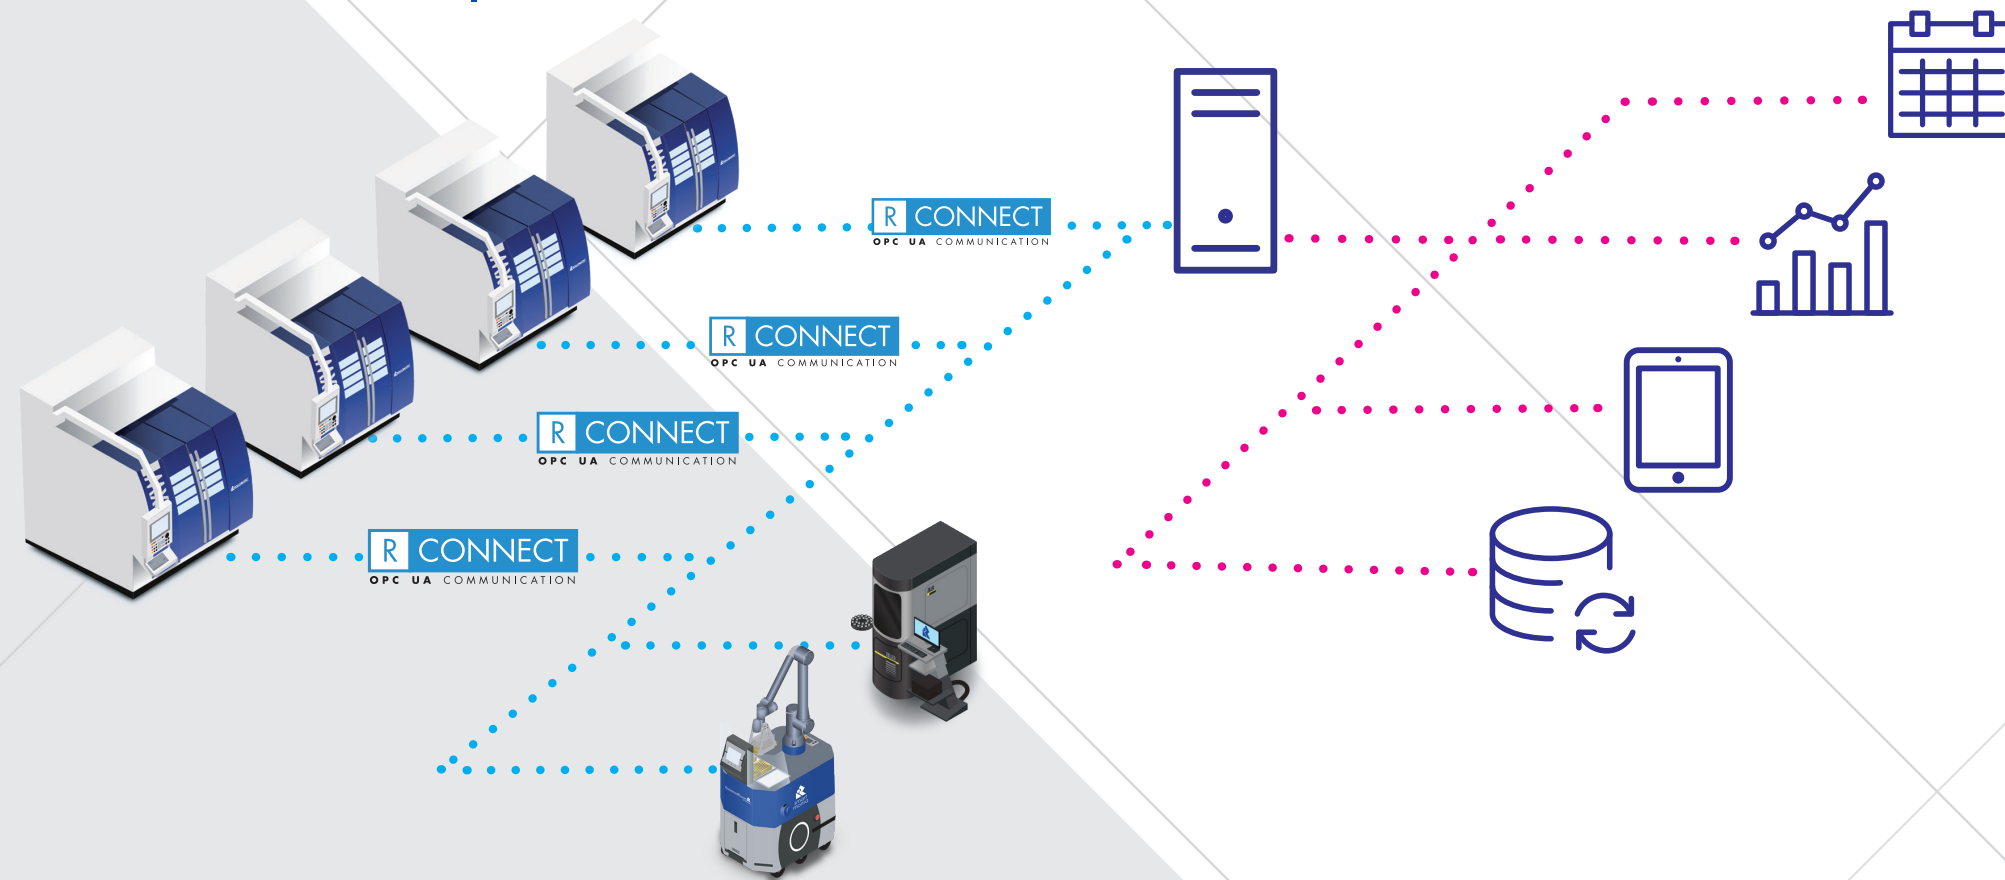

EN

Industry 4.0 is a constantly evolving world, and management tools have been developed to optimise its productivity. Rollomatic strives to develop connectivity solutions that are compliant with the UMATI standard, facilitating connections between peripherals in production processes and leveraging the available data.

To achieve this, we have two products at your disposal:

- RCONNECT, access to software and tooling data
- RMONITOR, a snapshot of machine productivity

RCONNECT

ACCESS TO SOFTWARE AND TOOLING DATA

RCONNECT provides you with all of the data from your machines in a structured format. This means you can develop your own monitoring environment and optimally leverage your production data.

RCONNECT extracts data from your Rollomatic machines using the OPC-UA communications protocol in compliance with the UMATI standard. Third party systems – such as your measuring machines and production management software – can read, write, and process this data through RCONNECT.

ADVANTAGES

- Fundamental access point to software and machine data
- Remote access to all information concerning the tools in production
- Available with single licence per machine
- Free updates for your machine's entire lifetime
- Standard OPC-UA protocol and UMATI structure
- No additional equipment is required

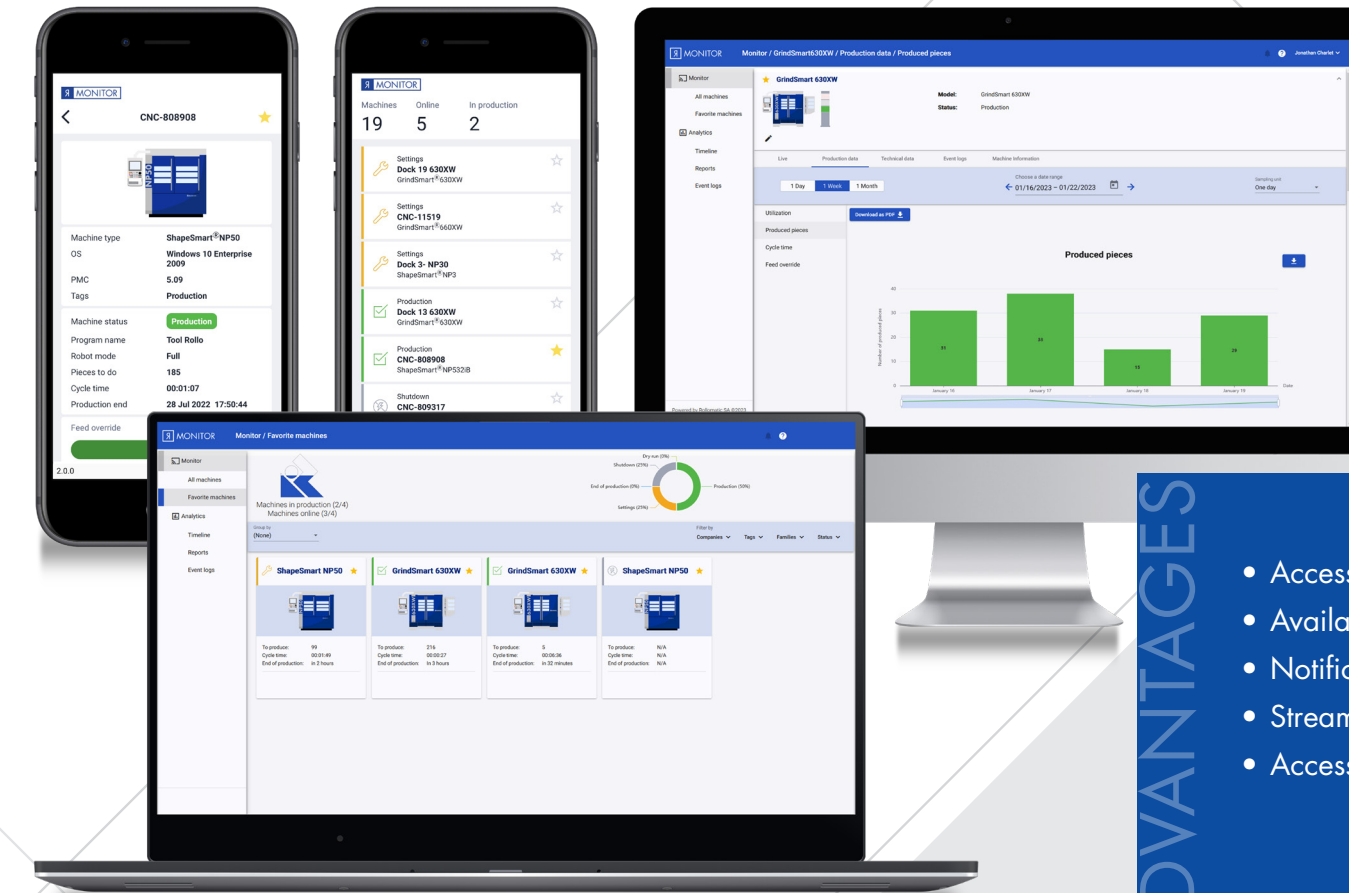

RMONITOR

A SNAPSHOT OF MACHINE PRODUCTIVITY

RMONITOR provides you with a clear, quick, and user-friendly overview of your production, from any device, securely, and wherever your company is based.

It provides a dashboard that gives you a clear overview of your machines' efficiency. You will be more pragmatic in your resource management, for optimal agility.

RMonitor works with all Rollomatic machines equipped with a PC, irrespective of the programming software used, and is easy to install thanks to a single internet connection.

ADVANTAGES

- Accessible anywhere
- Available on smartphones (Android and iPhone)
- Notifications when machine status changes
- Streamlined export of production report
- Access to event logs for all connected machines
